

$L\rho(\theta)\delta\theta$: # rapidities $\in [\theta, \theta + \delta\theta[$

$L\rho_s(\theta)\delta\theta = \delta I$: # states $\in [\theta, \theta + \delta\theta[$

$\nu(\theta) = \frac{\rho(\theta)}{\rho_s(\theta)}$: Occupation factor

$\rho(\theta) \rightleftharpoons \nu(\theta)$

(a) État fondamental (Mer de Fermi)

(b) Excitation de type I

(c) Excitation de type II

$\bullet$: quasi-particule
 $\circ$: trou

ρ : distribution de rapidité
 ρ_h : densité de trous

$\rho_s = \rho + \rho_h$: densité d'état
